

# EclipseFP & Leksah

TAIMO PEELO  
20.05.2009

# EclipseFP

- plugin for eclipse IDE platform
- goal is to support all kinds of functional programming languages in Eclipse
- current subprojects
  - Haskell module
  - Common module
  - Cohatoe module
  - OCaml module (admittedly dead)

# Downloading EclipseFP

- <http://eclipsefp.sourceforge.net/>
  - bit inactive, latest integration build 14 Sep 2008
  - see downloads section
    - natural choice: try the latest
  - current prerequisites
    - *JVM*  $\geq 5.0$
    - *eclipse*  $\geq 3.2$
    - *ghc* ?
      - I had 6.8.2

# Installing EclipseFP

- downloaded the archive, followed the instructions
  - no dice, nothing new in Eclipse
- argh, trying with update site then
  - <http://eclipsefp.sf.net/updates>
  - older version only, *0.10.0*

# Using EclipseFP

- Help → Contents → Functional Programming
- File → New Project → Haskell Project
  - ... and create new haskell module :)
- first things noticed
  - error reporting not exhaustive
  - autocompletion (code assist) dumb
  - run in GHCi /hugs does nothing
  - “navigate to” (ctrl + click) not present!?

# Still Using EclipseFP

- Haddock documentation generation
  - File → Export → Other → Haddock documentation

# Mysterious Cohatoe

- that bastard is not installed with EclipseFP :
  - ... and is not available from update site
  - version 0.12.0 distributed as *update site archive* at
    - <http://eclipsefp.sourceforge.net/cohatoe/index.html>
- contains runtime, SDK and examples
- “but what does it do, mummy?”
  - Help → Contents → Cohatoe ...
  - "Contributing Haskell (code) to Eclipse""

# Catching of the Cohatoe

- *Cohatoe Examples* menu appeared...
- EclipseFP has broken link to *cohatoe-api*
  - google for *cohatoe-api\_1.0.0.zip*
- Leif Frenzel has written Cohatoe quickstart
  - <http://cohatoe.blogspot.com/>

# Taming of the CohatOE

- ps ax | grep haskell
  - haskellserver 57053 /usr/lib/ghc-6.8.2
  - the beast is running :)

# Basic Cohatoe

- Eclipse plugin extensions :)
- consider Haskell function
  - doSmthWith :: String → String
  - ... and calling it from Eclipse plugin code

# Cohatoe: Extension Point

```
<extension point =
  "de.leiffrenzel.cohatoe.server.core.haskellFunctions">

<haskellFunction
  interface = "smth.IStrTransformer"
  implementation = "smth.IStrTransformerImpl"
  objectFile = "$os$/obj/theHaskellImpl.o"
  name = "Fancy string transformer in Haskell"
/>
</extension>
```

# Cohatoe: Interface/Implementation

```
interface IStrTransformer {  
    String transform(String s);  
}
```

```
class IStrTransformerImpl implements IstrTransformer {  
    public String transform(String s) {  
        String result = "Haskell was quiet";  
        // marshall params  
        // send to Cohatoe server  
        return result;  
    }  
}
```

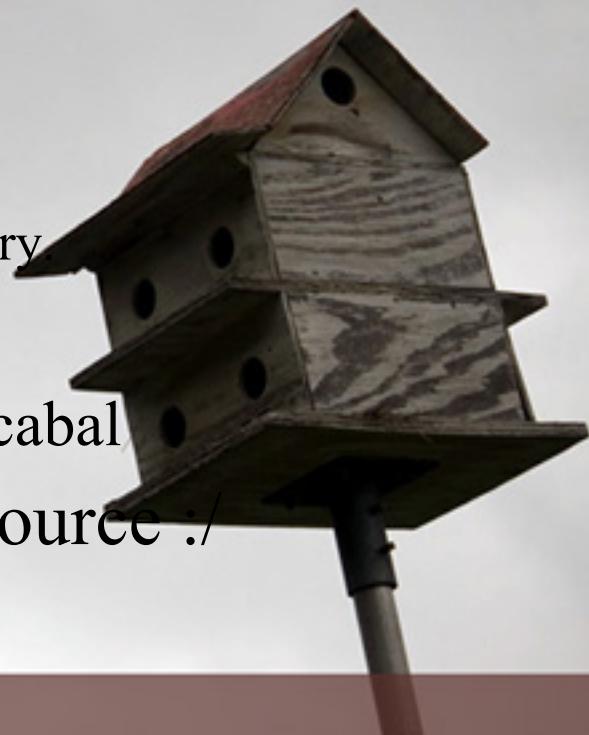

# Leksah

- Haskell IDE in Haskell
  - <http://leksah.org>
  - based on Gtk+ and gtk2hs
  - version 0.4 labeled first *beta* release

# Needy Leksah

- using Kubuntu 8.04, debian repositories
  - distro provides *ghc* 6.8.2
- dependencies of Leksah
  - gtk2hs  $\geq 0.10.0$
  - GHC  $\geq 6.10.1$ 
    - works with 6.10.2 & hopefully 6.10.3
      - but only if gtk2hs compiled from latest repository
  - cabal package file
    - Set Cabal version  $\geq 1.6.0.1$  in the leksah.cabal
  - recommends building everything from source :/

# Installing Leksah

- uninstalling distribution ghc packages
  - ghc6, ghc6-doc
  - libghc6-http-dev
  - libghc6-mtl-dev
  - libghc6-network-dev
  - libghc6-parsec-dev

# Still Installing Leksah

- GHC 6.10.3 (released 9 May 2009)
  - tar xvjf ghc-6.10.3-i386-unknown-linux-n.tar.bz2
  - cd ghc-6.10.3
  - ./configure –prefix=/home/taimo/apps/ghc-6.10.3
  - make install
  - cd /home/taimo/apps/ghc-6.10.3
  - ln -s ghc-6.10.3 ghc

# Leksah. Not There Yet.

- added to `~/.bash_profile`

```
if [ -d ~/apps/ghc ] ; then
    PATH=~/apps/ghc/bin:"${PATH}"
fi
```

- source `~/.bash_profile`

- install gtk2hs

- `tar jxvf gtk2hs-0.10.1.tar.bz2`
- `cd gtk2hs-0.10.1`
- `./configure`
- failed complaining about glib / gtk

# Road to Leksah

- still at gtkhs :)
  - installed bunch of libs with Adept Manager
    - libgio-dev, libgtk-2.0-dev, \*glib\*
  - repeated ./configure (success)
  - make (make few coffees while waiting)
  - sudo make install

# cabal install leksah

```
taimo@deficiency:~$ cabal install leksah
Resolving dependencies...
cabal: cannot configure leksah-0.4.4.1. It requires
gtksourceview2 >=0.10.0
There is no available version of gtksourceview2 that
satisfies >=0.10.0
```

At this point I find:

[http://haskell.org/haskellwiki/Leksah#Installation\\_for\\_Ubuntu](http://haskell.org/haskellwiki/Leksah#Installation_for_Ubuntu)

```
aptitude install libgtksourceview2.0-dev
```

**but still**

```
cabal: cannot configure leksah-0.4.4.1. It requires
gtksourceview2 >=0.10.0
```

# Attempted Leksah Install

- downloaded leksah-0.4.4.1.tar.gz

```
aptitude install libedit-dev  
tar zxvf leksah-0.4.4.1.tar.gz  
cd leksah-0.4.4.1  
mv leksah.cabal leksah.cabal.old  
sed -e 's/Cabal ==1.6.0.1/Cabal >=1.6.0.1/g'  
leksah.cabal.old > leksah.cabal
```

**but still**

cannot configure leksah-0.4.4.1. It requires  
gtksourceview2 >=0.10.0

# F\* Leksah.

- What do I do?
- Try distribution upgrade?
  - it won't complete in time for presentation
- recompile gtkhs as it uses sourceview?
  - sure!
  - wtf? /usr/bin/ld: cannot find -lgmp
  - apparently some stuff has gone missing?

```
sudo aptitude install alex happy \
libgmpxx4ldbl libgmp3-dev
```

# Continuing Leksah Install

- From now on, last instructions from
  - [http://haskell.org/haskellwiki/Leksah#Installation\\_for\\_Ubuntu](http://haskell.org/haskellwiki/Leksah#Installation_for_Ubuntu)

```
runhaskell Setup configure --user
```

```
runhaskell Setup build
```

```
src/IDE/Completion.hs:88:18:
```

Not in scope:

```
`sourceLanguageManagerGuessLanguage'
```

- libgtksourceview still wrong!

# Leksah: acquire libgtksourceview

- downloaded gtksourceview2\_2.6.1.orig.tar.gz
- removed \*libgtksourceview\* packages

```
./configure
```

```
sudo aptitude install intltool
```

```
./configure
```

```
make
```

```
sudo make install
```

# Leksah Installation: Final Steps

- yet another uninstall / rebuild / reinstall of gtk2hs

```
runhaskell Setup configure --user
```

```
runhaskell Setup build
```

```
runhaskell Setup install
```

- it starts up !!

# Using Leksah

- have no idea how to use it :)
- let's make a try with some project from
  - <http://code.haskell.org/gtk2hs/>
  - darcs get --partial <http://code.haskell.org/project>
